I. General Information

All reactions were carried out under an argon atmosphere with dry solvent under anhydrous conditions, unless otherwise noted. Dry acetonitrile (MeCN), dimethylformamide (DMF), dimethyl sulfoxide (DMSO), dichloromethane (CH_2Cl_2), tetrahydrofuran (THF) and toluene were obtained by passing commercially available pre-dried, oxygen-free formulations through activated alumina columns. Anhydrous benzene, acetone, chloroform (CHCl_3), methanol (MeOH), ethyl acetate (EtOAc) were purchased from commercial suppliers and stored under argon. Yields refer to chromatographically and spectroscopically (^1H NMR) homogenous material, unless otherwise stated. Reagents were purchased at the highest commercial quality and used without further purification, unless otherwise noted. Reactions were monitored by thin-layer chromatography (TLC) carried out on S-2 0.25 mm E. Merck silica gel plates (60 F₂₅₄) using UV light for visualization and/or an ethanolic solution of phosphomolybdic acid, an aqueous solution of cerium sulfate or a basic aqueous solution of potassium permanganate as developing agents. E. Merck silica gel (60, particle size 0.040–0.063 mm) was used for flash column chromatography. NMR spectra were recorded on a Bruker DRX-600 instrument and calibrated using the resonance signal of the residual undeuterated solvent for ^1H NMR [$\delta_{\text{H}}=7.26$ ppm (CDCl_3), $\delta_{\text{H}}=7.16$ ppm (C_6D_6), $\delta_{\text{H}}=1.94$ ppm (CD_3CN), and $\delta_{\text{H}}=3.31$ ppm (CD_3OD)] and deuterated solvent for ^{13}C NMR [$\delta_{\text{C}}=77.16$ (CDCl_3), $\delta_{\text{C}}=128.06$ (C_6D_6), $\delta_{\text{C}}=118.26$ ppm (CD_3CN), and $\delta_{\text{C}}=49.00$ (CD_3OD)] as an internal reference at 298 K. The following abbreviations were used to designate multiplicities: s=singlet, d=doublet, t=triplet, q=quartet, quint=quintet, m=multiplet, br=broad. Infrared (IR) spectra were recorded on a PerkinElmer 100 FT-IR spectrometer. High-resolution mass spectra (HRMS) were recorded on an Agilent ESI-TOF (time of flight) mass spectrometer using MALDI (matrix-assisted laser desorption ionization) or ESI (electrospray ionization). Optical rotations were measured on a Schmidt+Haensch Polartronic M100 polarimeter at 589.44 nm using 100 mm cells and the solvent and concentration indicated, and are reported in units of 10^{-1} (deg cm² g⁻¹).

13¹ (500 mg, 2.45 mmol, 1.0 equiv) in CH₂Cl₂ (10 mL) at 23 °C was added a Co₂(CO)₈ (1.00 g, 2.94 mmol, 1.2 equiv) in one portion. After 20 min, a solution of **11²** (887 mg, 4.89 mmol, 2.0 equiv) in CH₂Cl₂ (6 mL) was added. The resulting mixture was cooled to 0 °C, and BF₃·Et₂O (604 µL, 4.89 mmol, 2.0 equiv) was added dropwise. After 0.5 h, the reaction mixture was carefully quenched by the addition of saturated aqueous NaHCO₃ solution (30 mL), and allowed to warm to 23 °C. The aqueous layer was extracted with CH₂Cl₂ (3 × 20 mL) and the combined organic layers were dried over anhydrous Na₂SO₄, filtered, and concentrated under reduced pressure.

To a stirred solution of the so-obtained crude residue in acetone (30 mL) was added portion wise diammonium cerium(IV) nitrate (CAN) (6.71 g, 12.2 mmol, 5.0 equiv) at 0 °C. The filtrate was concentrated under reduced pressure to give crude

exocyclic olefin **26** (90.2 mg, 0.173 mmol, quantitative yield), which was used in the next step without further purification.

To a stirred solution of the obtained exocyclic olefin **26** (90.2 mg, 0.173 mmol, 1.0 equiv) in toluene (10 mL) at 23 °C were added *n*-Bu₃SnH (100 µL, 0.346 mmol, 2.0 equiv) and AIBN (14.2 mg, 0.0865 mmol, 0.5 equiv). The resulting mixture was transferred and submerged into a preheated oil bath (90 °C) and stirred for 2 h before it was allowed to cool to 23 °C. The resulting mixture was concentrated under reduced pressure. Flash column chromatography (SiO₂, hexanes/EtOAc 20:1, *v/v* → 2:1, *v/v*) of the residue afforded the corresponding organotin intermediate (80.1 mg, 0.102 mmol, 58% yield) as a colorless oil.

To a stirred solution of the residue obtained above (mixture of isomers, 80.1 mg, 0.102 mmol, 1.0 equiv) in MeOH (4 mL) at 23 °C was added *p*-TsOH·H₂O (17.5 mg, 0.102 mmol, 1.0 equiv). The resulting mixture was stirred for 45 min and then diluted with saturated aqueous NaHCO₃ solution (10 mL). The aqueous layer was extracted with EtOAc (3 × 10 mL). The combined organic layers were washed with brine (10 mL), dried over Na₂SO₄, filtered, and concentrated under reduced pressure. Flash column chromatography (SiO₂, 5 → 20% EtOAc in hexanes) of the residue afforded **27** (40.7 mg, 0.0816 mmol, 80% yield) as a colorless oil.
